

DSST389: Assessment IV

Please respond to each of the following prompts **by hand**, in your own writing. There are no wrong answers. I'm interested in your thinking, not in reciting specific tools or syntax. I suspect this will take about 1 hand-written page to answer the questions, but the specific length is up to you.

1. Over the course of this semester, we've worked through the full arc of a data science project — from collecting and cleaning raw data to building and evaluating models. What idea, principle, or way of thinking from this class has changed how you approach problems? This doesn't have to be technical; it could be a habit of mind, a question you now ask that you didn't before, or a shift in how you interpret claims made with data.
2. Most of you are about to graduate into a world that increasingly runs on data. Describe a domain, problem, or context where you could see yourself applying the thinking and methods from this course. What would the hard parts be? What would you want to learn more about to do it well?
3. What was your favorite dataset or topic we explored this semester, and what made it stick with you? This could be about the data itself, something surprising you found in it, or the way a particular technique clicked into place.
4. Note anything else you'd like to share.

Please drop off your answers to my office (under the door is fine) in 316 INTL sometime before midnight on Thursday, 23 April.
